def main(ngen, psize,  pc, nvm, clones, function, vhigh):
    """ Main function to call nsgaii to solve multi objective
    0/1 knapasack prpoblems

    Parameters
    ----------
        ngen:      integer       number of generations
        psize:     integer       population size
        pc:        real          crossover rate
        nvm:       integer       number of variables to mutate
        clones:    boolean       true/false
        function:  function name fitness function to optimize

    Returns
    -------
    Population
        The evolved population

    Comment
    -------
    Some problems
        KP_p-2_n-100_ins-1.dat
        KP_p-3_n-100_ins-1.dat
        KP_p-4_n-40_ins-1.dat
        KP_p-5_n-20_ins-1.dat
